@AIMS

What is aims.fao.org?

- Web portal managed by FAO of the UN that disseminates standards and good practices in information and knowledge management for the support of the right to food, sustainable agriculture and rural development
- Supports the implementation of structured and linked information by fostering a community of practice centered on the themes of interoperability, reusability and cooperation

What do we do?

- To help to make agricultural information increasingly accessible
- To promote good practices widely applicable and easy to implement
- To adopt, create and publicize standards, tools and services enabling stakeholders to build open and interoperable information systems

Aid to Semantic Navigation and Visibility

Use of Controlled Vocabularies

What is a controlled vocabulary?

- List of terms (e.g. words, phrases) that is used to tag (label) information in a consistent way
- There are different types of vocabularies like
 - authority files, classification systems, controlled lists, ontologies, taxonomies, glossaries, subject headings etc.
- Objective is to facilitate the retrieval of content

Uses: indexing

Subject vocabularies (words or phrases taken from standardized, organised knowledge structures) should be employed to resolve indexing problems such as **plurals, spelling variants, synonyms, homographs** (words with same spelling but different meaning), and **polysemes** (words with multiple meanings) by ensuring that each concept is described using only one authorized term and each authorized term in the controlled vocabulary describes only one concept.

Uses: enhancing access

The use of subject vocabularies guarantees meaningful metadata while also enhancing the quality of the interoperability and effectiveness of information exchange among data providers, thus facilitating the re-usage of data by other repositories/services and in the process adding value to the local researcher.

AGROVOC

A controlled vocabulary in the agricultural field

AGROVOC

- Controlled vocabulary covering all areas of interest to FAO, including food, nutrition, agriculture, fisheries, forestry, environment etc.
- Contains over 32,000 concepts organized in a hierarchy, each concept may have labels in up to 22 languages

Uses

- Standardizes the indexing process in order to make searching simpler and more efficient and to guide the user to the most relevant sources
- Used worldwide (researchers, information management specialists) for indexing, retrieving and organizing data in agricultural information systems

Concept Scheme

- Developed in the early 80s, as a thesaurus to support uniform indexing of the AGRIS bibliographic database, and then of the whole FAO bibliographic catalogue.
- Thesaurus expressed as a concept scheme using SKOS
- This conversion from a relational database has provided added semantics value to term relationships

Concepts

- Meant to represent the *meaning* of terms
- Set of all terms considered to be translation of one another in various languages
- Concepts are given dereferenceable URIs (= URL), such as http://aims.fao.org/aos/agrovoc/c_12332 for maize.

Terms

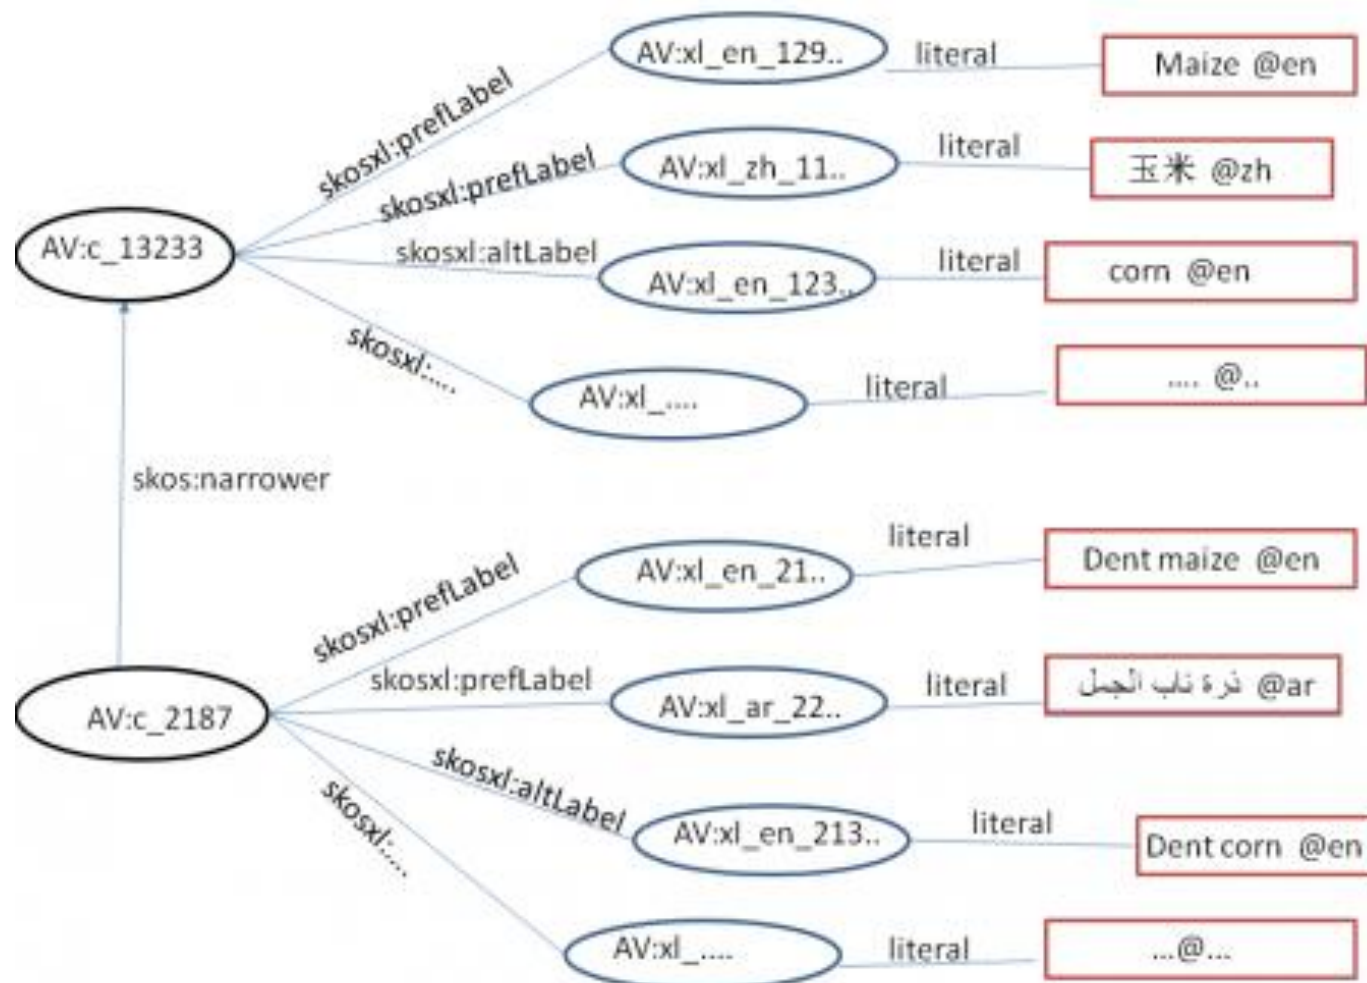

- Or labels, are the actual terms used to name things or abstract concepts
- For example maize, maïs, 玉米, ข้าวโพด, are all labels for the same concept in English, French, Hindi respectively.

Relations, between concepts or terms

- **Concepts:** Hierarchical relations between concepts correspond to the classical thesaurus relations broader/narrower (BT/NT)
- **Terms:** range of forms that can occur for each term such as spelling variants, singular or plural, for example organization or organisation, cow or COWS

Maintenance

Collaborative effort

AGROVOC is kept up to date by the AGROVOC team in FAO, by a number of involved institutions serving as focal points for specific languages, and by individual domain experts

AGROVOC and Linked Open Data

Towards the Semantic Web

The Semantic Web

- The main difference between the web of hypertext and the Semantic Web is that while the first links in html pages or documents, the second calls for going beyond the concept document and link structured data
- In this context, Linked Data is the set of best practices for publishing and connecting structured data on the Web
- Its main objective is to liberate data from silos that are framed by proprietary database schemas

Four rules

- Defined by Tim Berners-Lee in 2006:
 - to use URIs (uniform resource identifiers) to identify resources uniquely;
 - to use http URIs so people can access the information about the resource;
 - to provide information about the resources using standard formats like RDF/XML; and
 - to include links to other resources, URIs, enhancing the linking between different resources distributed on the web.

What is Linked Open Data?

- Linked Open Data (LOD) is Linked Data distributed under an open license that allows its reuse for free.
- In 2010, Tim Berners-Lee defined a 5-star rating scheme to encourage data providers to provide linked data under open licenses.
 - The scheme uses gold stars to evaluate the availability of linked data as linked open data.

How to facilitate the linking between resources?

- The easiest way is the use of standard vocabularies, including standard vocabularies for describing data/metadata elements and standard vocabularies for indicating values.

AGROVOC as Linked Open Data

- The additional value that linking AGROVOC to other vocabularies provides is that data repositories attached to those vocabularies become discoverable
- This is a very simple classic case of exposing repository contents automatically across datasets through AGROVOC indexing.

AgriOcean DSpace

- Joint initiative between the United Nations agencies of FAO and UNESCO-IOC to provide a customized version of DSpace using standards and controlled vocabularies in oceanography, marine science, food, agriculture, development, fisheries, forestry, natural resources and related sciences.
- The communities supported by FAO and UNESCO-IOC/IODE are synergistic and the standards on metadata and controlled vocabularies are similar for both.
 - Communities: AGRIS – ASFA - ODINS
 - Standards: Agris AP – MODS
 - Thesauri: AGROVOC – ASFA

AgriOcean DSpace

The United Nations agencies of FAO and UNESCO-IOC/IODE have announced a joint initiative to provide a customized version of DSpace using standards and controlled vocabularies in oceanography, marine science, food, agriculture, development, fisheries, forestry, natural resources and related sciences

The communities of FAO and UNESCO-IOC/IODE active in oceanography and food, agriculture, development, fisheries, forestry, natural resources and related sciences will provide a bespoke repository software based on DSpace to offer Open Access to the literature. They will use the same high standards for metadata, thesauri and other ontologies ensuring advanced access to the scientific publications in the field and the possibility to create new services for their researchers.

Welcome to the IBSS Institutional Repository!

Repository preserves and distributes digital collections including: IBSS serials, theses, research reports, preprints, papers, image collections etc.

If you are a member of the IBSS research community and you are interested in contributing digital content, please contact the repository administrator repository@ibss.org.ua

We are moving to the new DSpace version, modified in the frame of AgriOcean project. Some bugs may be present at this moment.

Ontology plug-in: concept & implementation

- Tool for submission of metadata
- Search over different vocabularies:
 - Grouping of vocabularies is possible
 - submitter does not have to think about which vocabulary to use
- Independent tool that can be integrated in different systems
- It searches AGROVOC webservice, and an ASKOSI server containing the AGROVOC, ASFA, Plant Ontology and NERC-C19 (An Oceanographic Geographical ontology) ontology.
 - The broker can be extended to access any web service

Demo at <http://193.190.8.15/ontwebapp/ontology.html>

The screenshot shows a web browser window titled 'OntologyApp' with the address bar displaying '193.190.8.15/ontwebapp/ontology.html'. The page content includes a search bar, a list of search results, and a section titled 'Enter plug-in' which is highlighted with a red box. Below this, there is a 'Demo site for Ontology plug-in' section with instructions on how to use the tool. The background of the slide features a stack of three overlapping browser windows showing the same interface.

Enter plug-in

- Lagoons - agrovoc - c_4158
- Lagoonal sedimentation - asfa - asfa_6811
- North Atlantic Ocean - nerc - seavoxbody_1
- Antarctic freshwater bodies - nerc - seavoxbody_SVX00002
- Northern lobster fisheries - asfa - asfa_2208

Demo site for Ontology plug-in

Use:

- Fill out a term. ex. lagoon, flower, adriatic (topics: agriculture, aquatic science, plants, oceanographic locations).
- Don't forget to click on the Search button.
- Click on a term of the result list.
- Navigate through the thesauri/ontologies.
- Tick the terms that you want to select
- Use the history, start another search or save
- **The goal of the ontology plug-in is to be integrated in other applications, first of all in the submission module of AgriOcean DSpace**

Background:

The ontology plug-in was created by Dimitri Surinx, Jeroen Vaelen and Niki Vandesbosch (students at Hasselt University) in August 2012. The first version was realized under supervision of Dirk Leinders, ICT Department, and in cooperation with Christophe Dupriez (Destin). The plug-in is very useful as an authority tool in the submission process of any repository, document or content management system.

The ontology plug-in searches multiple thesauri and ontologies simultaneously by using a web service broker. The broker can be configured to access any web service. At this moment, it searches FAO's Agrovoc webservice, and an ASKOSI server containing the AGROVOC, ASFA, Plant Ontology and NERC-C19 (An Oceanographic Geographical ontology) ontology.

Roadmap

- Inclusion in AgriOcean Dspace 2.0 (March 2014)
- Availability for other projects:
 - On Google Code
- Options for further developments:
 - Extended view of relations: now only direct relations
 - Graphical interface
 - Other implementation

Ontology plug-in

- The ontology plug-in was created by Dimitri Surinx, Jeroen Vaelen and Niki Vandesbosch (students at Hasselt University) in August 2012.
- The first version was realized under supervision of Dirk Leinders, ICT Department, and in cooperation with Christophe Dupriez (Destin – ASKOSI - <http://www.destin-informatique.com/ASKOSI/>).
